

Arched Frames

The Design.

Arched frames have contributed to elegant architectural design for hundreds of years, and are valued principally for their strength and simplicity.

Arched window frames often fill a room with natural light leaving the home feeling brighter and more spacious. On top of this, arched frames help enhance other features, such as French Doors or a beautiful view.

How They're Made.

All of our profile can be bent as long as the radius of the reveal is sufficient. Upon ordering your arched window, porch or door frame, our surveyor will construct a cardboard template, which allows us to determine the exact curve of the frame.

The template and profile is then sent to our trusted, specialist bending company where the frame sections are gently heated to the required temperature. Whilst at that temperature, they are laid across a peg board which mimics the desired curve. On cooling, the profile maintains its new shape and the rest of the frame is welded to it.
